**Providing Services**

To solve various issues facing society, CYBERDYNE makes full use of "Cybernetics" (a new field that integrates and combines human, robot, AI, and information systems) and handles HCPS (Human-Cyber-Physical Space) in a unified manner. The technology is used to help people maintain a high degree of independence and lead a life with a higher degree of freedom, even if their physical condition declines due to disease, accident, aging, or disability. The business of Cyberdyne extends to various fields such as medical, care, construction, distribution, aviation, agriculture, sports, and many more.

**Project Achievement / Technical Expertise**

CYBERDYNE is best known for the world's first Wearable Cyborg technology that improves, regenerates, expands, and supports the wearer's physical functions. It was used for the first time to enable patients with disabilities to move according to their intention and induce recovery of their body functions. The usage is now expanding to other fields, such as supporting workers who must lift heavy weights daily, training athletes' agility skills, and supporting seniors in the training of their body core. New usage of this technology is constantly being found.
